Subject: Bedford Anodizing ceiling increase

Mark,

The vats with liquid waste are in poor condition, one of them was discovered leaking while the emergency cleanup of the floor spills was underway. It is anticipated that more leaks will develop in the near future, especially in the acid vats. These vats are not lined. I would like to request a ceiling increase to continue this emergency action to treat and/or remove the liquids from the site. I estimate that we have spent \$15,000 on the action to date and that will increase as we have to remobilize to pump out the exterior pits if they fill up again with caustic liquids. The state has estimate that there are 200,000 gal of liquid on site. I am still waiting for the START estimate which should be more accurate. If I could get another \$200,000 to keep this response moving I should be able to bring in the equipment needed to treat the liquid with possible discharge to the sanitary sewer. What do you think?
